Brief concept:

STRUCTURAL ANALYSIS & MACHINE

- Consist of an assemblage of numerous members
- Aim to determine the forces supported by the individual members of a structure (truss, frame) or machine
- Structure – an arrangement of individual members that is intended to support forces
- Machine – an arrangement of individual members where the goal is to transmit motion or force
- Trusses – consists of 2-force members only. It can be solved using JOINT or SECTION method. There is possibility that a truss member supports no force-
ZERO FORCE MEMBER
- Frames/machines – consists of at least one multi-force member.
